

Ideation Phase

Brainstorm & Idea Prioritization Template

Date	26-06-2026
Team ID	
Project Name	Nutrition Assistant
Maximum Marks	4 Marks

Brainstorming provides a free and open environment that encourages everyone within a team to participate in the creative thinking process that leads to problem solving. Prioritizing volume over value, out-of-the-box ideas are welcome and built upon, and all participants are encouraged to collaborate, helping each other develop a rich amount of creative solutions.

Step-1: Team Gathering, Collaboration and Select the Problem Statement

Each team member contributed their own framing of the problem based on user research and the Priya persona/empathy map. These individual notes were discussed and converged into a single, agreed problem statement:

"People want to eat better but don't have time for manual calorie math."	"There's no single place to search food and log what I eat."	"Most tracking apps are cluttered or require a paid subscription."
"Nutrition information online is scattered and sometimes contradictory."	"I want to see my daily progress without digging through menus."	"Beginners don't know if they're getting enough protein or too much fat."

Converged Problem Statement

"Health-conscious individuals, students, and working professionals struggle to track their daily calorie intake and understand the nutritional value of the foods they eat — most rely on manual calculations, paper notebooks, spreadsheets, or complex, cluttered apps that are time-consuming and hard to maintain. This slows down the formation of healthy eating habits and discourages people from sticking with nutrition tracking long enough to see results."

Step-2: Brainstorm, Idea Listing and Grouping

Raw ideas generated during the brainstorming session were clustered into affinity groups representing the core modules of Nutrition Assistant:

Food Search & Nutrition Data

Searchable, filterable food database	Instant nutrition lookup (calories, protein, carbs, fat)	Serving-size aware nutrition values
--------------------------------------	--	-------------------------------------

Calorie & Macronutrient Tracking

Log daily food intake with quantity	Automatic calorie total calculation	Macronutrient breakdown per meal and per day
-------------------------------------	-------------------------------------	--

Dashboard & Reporting

Personalized daily nutrition summary	Visual charts for calories and macros	Progress tracking over time
--------------------------------------	---------------------------------------	-----------------------------

User Experience & Access

Simple registration & secure login	Clean, beginner-friendly dashboard	Responsive, mobile-friendly UI
------------------------------------	------------------------------------	--------------------------------

Future Growth Ideas

Barcode scanning & photo-based logging	AI-based meal recommendations	Mobile app & community features
--	-------------------------------	---------------------------------

Step-3: Idea Prioritization

Grouped ideas were then plotted on an Impact vs. Effort matrix to decide what to build first. High-impact, low-effort items were prioritized for early sprints, while low-impact, high-effort items were deferred to the Future Scope.

Do First — High Impact / Low Effort • User registration & login • Basic food search • Daily intake logging	Major Projects — High Impact / High Effort • Nutrition database integration • Automatic calorie/macro calculation engine • Interactive nutrition dashboard • Real-time totals recalculation
Fill-Ins — Low Impact / Low Effort • UI polish & theming • Onboarding tooltips/help text	Reconsider — Low Impact / High Effort • Barcode/photo-based food scanning • Native mobile app • Community/social features
